PHP Assignment

Description:

You need to develop a web application that maintains information of different companies and users in the relational database. Design & implement this application and demonstrate the functionality.

Following is the list of functionalities that we need to implement in this application:

1. Add a Company [Name, City]

2. Add a User [Name, Email, Phone]

3. Allocate a User to one or more Companies

4. List Users [Name, Email, Phone, Allocated Companies (comma separated string)]

5. Delete a given Company

6. Get a User's data for a given Company

Notes:

- Implement backend for this web application.

- Create UI for any JS framework, Responsive UI

- Assume a suitable authentication mechanism but no need to implement it now.

- Use of internet is **ONLY FOR REFERENCE**; copying code from any sources is **STRICTLY PROHIBITED.**

Instructions for assignment:

- Readme file for how to setup project - (Laravel/Codeignitor/Other)
- Database file with sample data (.sql) - (mostly known as migration and seeder)
- All links/routes/URLs
- Any specific notes.
